

Key Terms

- Bulk Plant
- Distribution Terminal
- Fossil Fuel
- Liquefied Petroleum

Propane Facts

- Propane is a nontoxic gas. It is released as a gas and will not contaminate soil or groundwater supplies. Therefore, propane is exempt from the U.S. Environmental Protection Agency's tough underground storage regulations.
- Propane is considered a safe motor fuel by the federal government. School buses run on propane.
- About 97 percent of the U.S. propane supply is produced in North America, and 88 percent of that is produced in the United States.
- The U.S., Canada and Mexico have extensive natural gas reserves. The majority (75 percent) of imported propane comes from Canada.

Propane

What is propane?

Propane is an energy-rich gas that is related to petroleum and natural gas. Propane is usually found mixed with deposits of natural gas and petroleum underground. Propane is called a *fossil fuel* because it was formed millions of years ago from the remains of tiny sea animals and plants.

Propane is one of the many fuels that are included in the *liquefied petroleum* (or LP-gas) family. In the United States, propane and LP-gas often mean the same thing, because propane is the most common type of LP gas used.

Just as water can be a liquid or a gas (steam), so can propane. Under normal conditions, propane is a gas. But under pressure, propane becomes a liquid.

Propane is stored as a liquid fuel in pressurized tanks because it takes up much less space in that form. Gaseous propane takes up 270 times more space than liquid propane. A thousand gallon tank holding gaseous propane would provide a family enough cooking fuel for one week. The same tank holding liquid propane would provide enough cooking fuel for more than five years. Propane becomes a gas when it is released to fuel gas appliances.

Propane is nonrenewable.

Propane is very similar to natural gas. Like natural gas, propane is colorless and odorless. An odor is added to propane so escaping gas can be detected. And like all fossil fuels – coal, petroleum and natural gas – propane is a nonrenewable energy source.

The History of Propane

Propane has been around for millions of years, but it wasn't discovered until 1912. Scientists were trying to find a better way to store gasoline, which evaporated when stored.

Continued on back

An American scientist, Dr. Walter Snelling, discovered that propane gas could be changed into a liquid and stored at moderate pressure. Just one year later, the commercial propane industry began heating American homes with propane.

Producing Propane

Propane comes from natural gas and petroleum wells. Forty-six percent of the propane used in the United States comes from raw natural gas. Raw natural gas is about 90 percent methane, about five percent propane and about five percent other gases. The propane is separated from the other gases at a natural gas processing plant.

Forty-five percent of propane supplies come from petroleum and nine percent is imported. Petroleum is separated into various fuels at an oil refinery. Petroleum's most important product is gasoline – and propane is another.

Transporting Propane

How does propane get to the people who use it? Propane is usually moved through underground pipelines to distribution terminals across the nation. *Distribution terminals* are like warehouses that store merchandise before shipping it to stores. Sometimes in the summer, when people need less energy for heating, propane is stored in large underground caverns.

From the distribution terminals, propane goes by railroad, trucks, barges and supertankers to bulk plants. A *bulk plant* is where local propane dealers come to fill their small tank trucks.

How is propane used?

Propane provides the U.S. with almost 2 percent of its energy. Propane is used in homes, farms,

business and industry – mostly for heating. It is also used as a transportation fuel.

- **Homes** - Propane is mostly used in rural areas that do not have natural gas service. Homes use propane for heating, hot water, cooking and clothes drying. Many families have barbecue grills fueled by propane gas. Some families have recreational vehicles equipped with propane appliances.
- **Farms** - Half of America's farms rely on propane to meet their energy needs. Farmers use propane to dry crops, power tractors and to heat greenhouses and chicken houses.
- **Business** - Businesses, like office buildings, laundromats, fast-food restaurants and grocery stores, use propane for heating and cooking.
- **Industry** - Certain industries find propane well-suited to their special needs. Metal workers use small propane tanks to fuel cutting torches. Portable propane heaters give construction and road workers warmth in cold weather.

Propane is also used to heat asphalt for highway construction and repairs. And because propane burns so cleanly, forklift trucks powered by propane can operate safely inside factories and warehouses.

- **Transportation Fuel** - Propane has been used as a transportation fuel for many years. Today, many taxicab companies, government agencies and school districts use propane instead of gasoline to fuel their fleets of vehicles. Propane has several advantages over gasoline. Propane is clean burning and leaves engines free of deposits. In addition, engines that use propane release fewer pollutants into the air than engines that use gasoline.
